

Records for Adult Orthodontic Diagnosis

Today Dr. Adams has recommended that a set of diagnostic records be created to evaluate your specific orthodontic needs in detail.

At the diagnostic records appointment, both a thorough clinical evaluation, facial and intraoral photographs, a panoramic jaw and a profile radiograph will be obtained along with study model impressions. No discussion will be held at that time relating to diagnosis or treatment needs, therefore, both parents need not be present for this record taking appointment.

Considerable time and effort will be spent measuring and analyzing the records to determine your specific orthodontic problems and communicate our treatment considerations and recommendations. Dr. Adams uses an advanced computer analysis and will put together an easy to understand visual presentation for you that will help you understand your orthodontic problems, solutions, and treatment options.

A conference will then be scheduled approximately four weeks after the records have been taken. During this thirty minute conference, specific information concerning your orthodontic problems, treatment considerations, recommendations, and cost will be discussed with you. All interested parties should be present at this appointment so that they can understand the orthodontic problems presented and ask any questions that they might have. Detailed information will be discussed with you at this appointment: therefore, it is advised that *young children not accompany you if they will distract you* from this discussion.

I understand that the fee for the Diagnostic work-up, Panoramic X-ray, Cephalometric, X-ray, Computer Analysis, Study models, and Diagnostic presentation is \$278.00. (An additional \$40.00 fee is due for those cases that could possibly involve surgical correction.)
